ROLLDEPUR RFC-20/GM

RFC-20-GM is a centrifuge for continuous filtering of mud from waste water.

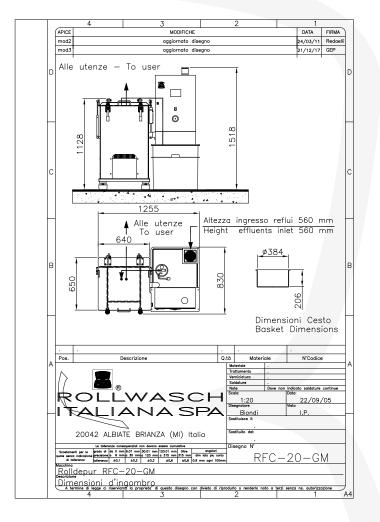

Rolldepur RFC-20-GM is a centrifuge for the continuous filtering of mud coming from mass surface finishing processes.

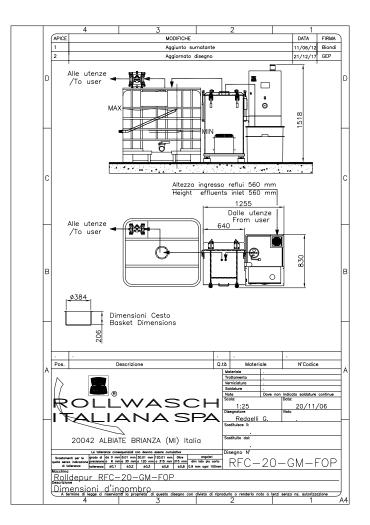

This type of machine is having a wide success in particular to separate, through waste waters centrifugation, the most part of mud contained in the same and to return the liquids to the finishing process. Usually this process happens in continuous and repeatedly within a certain time limit, which is determined by the mud thickness and by the pumped waste waters quantity, at the end of which the machine automatically stops (timer) and the operator empties the mud basket and starts again the operation.

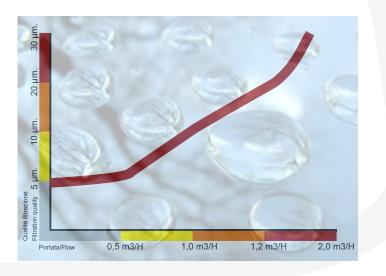

Rolldepur RFC-20-GM-FOP is a centrifuge for continuous filtering of mud coming from waste waters with the same features described for the previous model. This version is equipped with an additional tank (type SPUL-1000/PE) for the storage of the clarified waters and with a RILPO-PM-120/E pump assembled on the upper side. Furthermore it is provided with piping and connections, no-return valve and delivery rubber holder to send the clarified water to the plant.

ROLLDEPUR RFC-20/GM

Quality/hourly flow rate ratio:

It is important to understand the tendence that centrifugal filtration has in relation to ratio between flow and quality of resulting filtered liquid coming out. The filtering capacity is as high as the machine has a low flow (best value: around 500÷1200 lt/hour); Subject to evaluation of the percentage content of suspended solids and pollutants in wastewater.

Safety:

In Italy the use of this type of machine is subject to the legislative decree: art. 71 c.11 D.Lgs 81/2008 and s.m.i. - in other countries it is useful to check any similar provisions - the Rollwasch staff is available for further information.
